SCALING CAT QUBITS WITH ENABLING TECHNOLOGIES

Rémi de La Vieuville

TQCI / September 5, 2024

Quantum computing revolution will be unlocked by error rate reduction.

Enabling technologies is one of the main challenge for scalability.

FULL-FLEDGED QUANTUM COMPUTER RESOURCE ESTIMATE

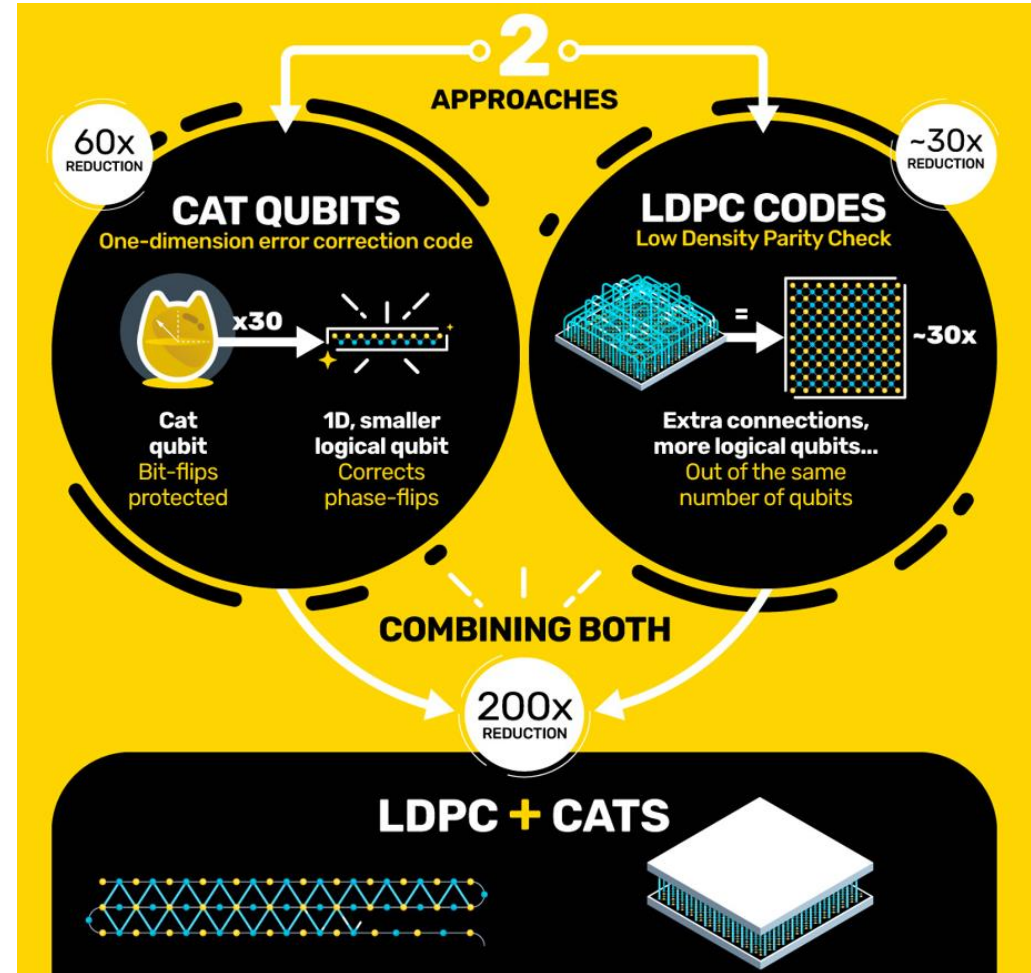

THE LAST DASH TO USEFUL QUANTUM COMPUTING

SAVING ON HARDWARE

Alice & Bob latest research shows how to reduce the footprint of a powerful quantum computer by **200-fold**

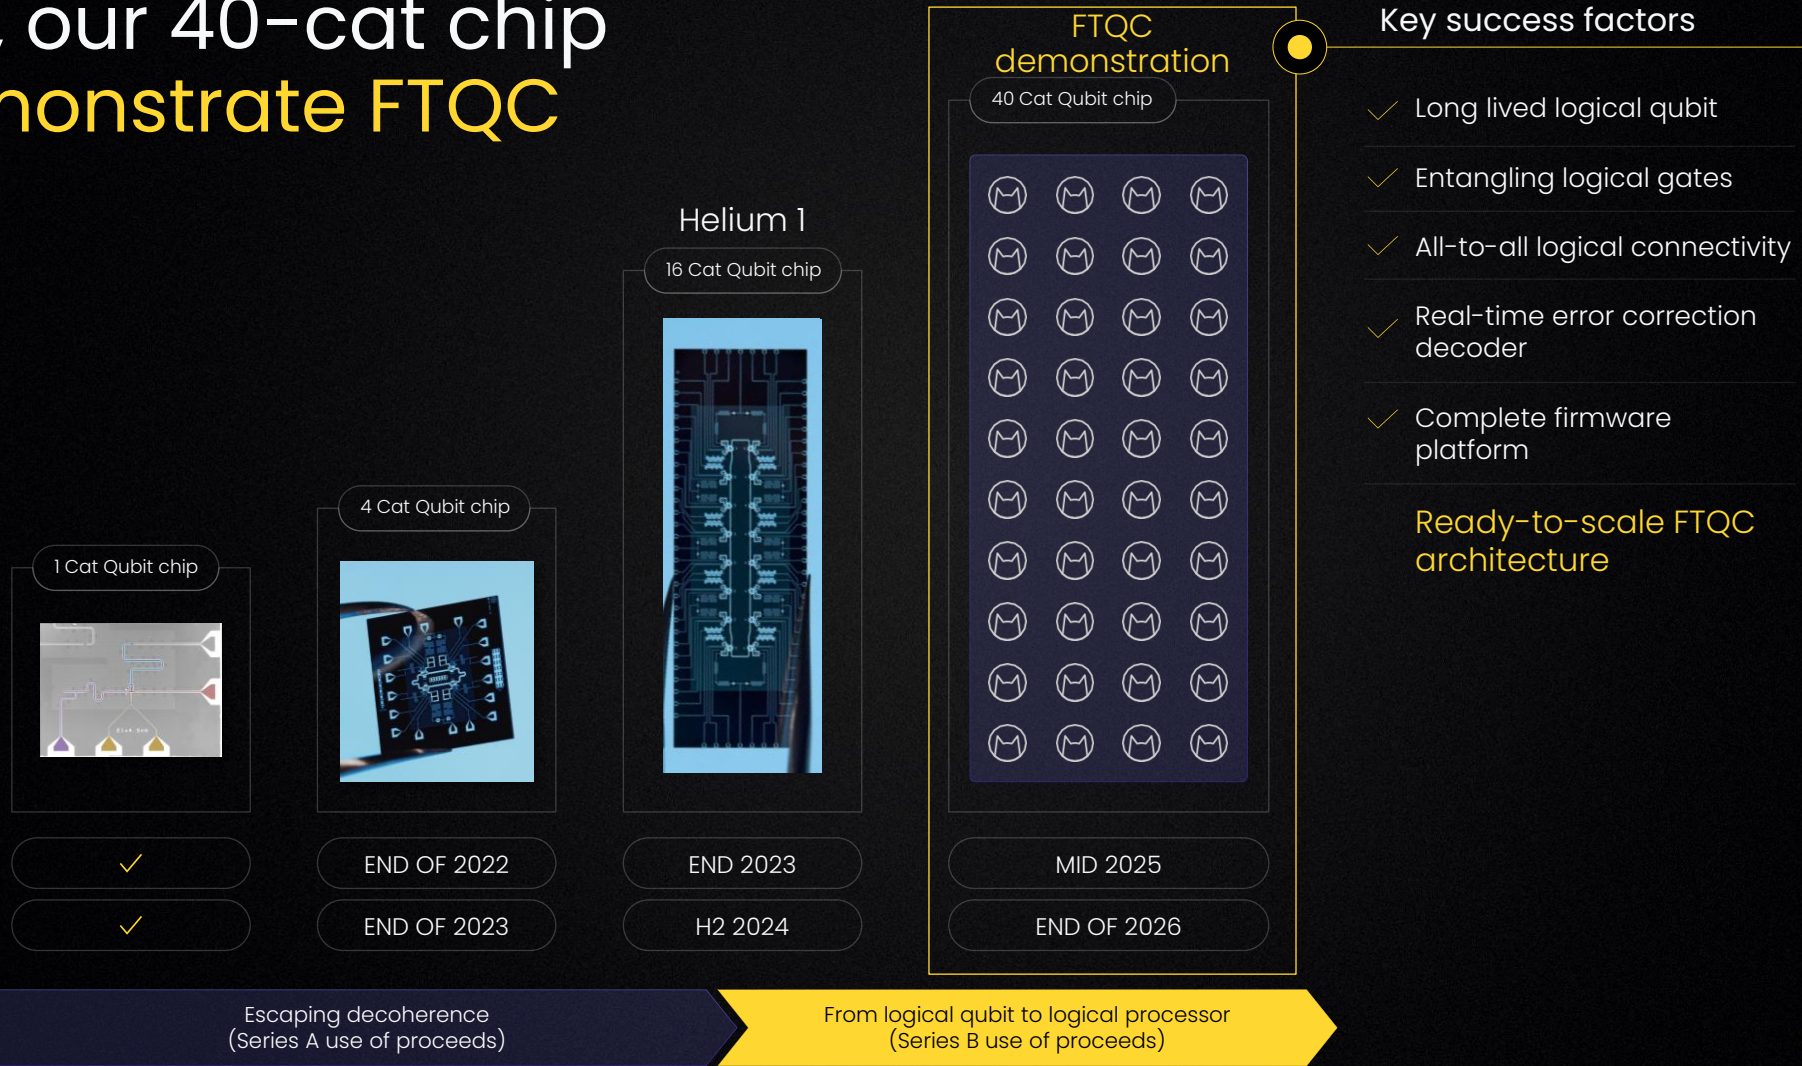

It is one step further making quantum computing realistic, earlier

In collaboration with INRIA

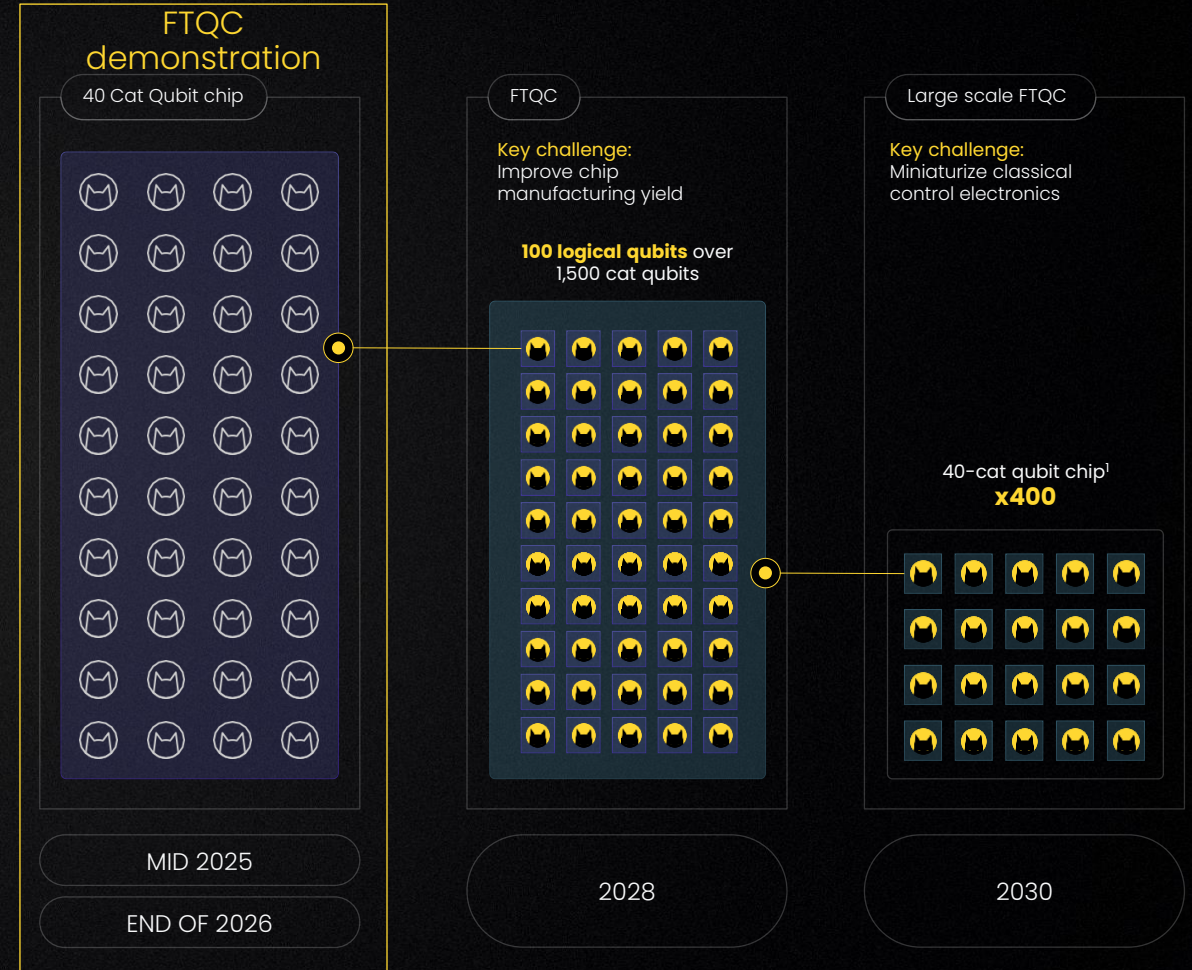

In 2026, our 40-cat chip will demonstrate FTQC

This demonstration will enable manufacturing outsourcing and architecture scaling to build the 1st FTQC

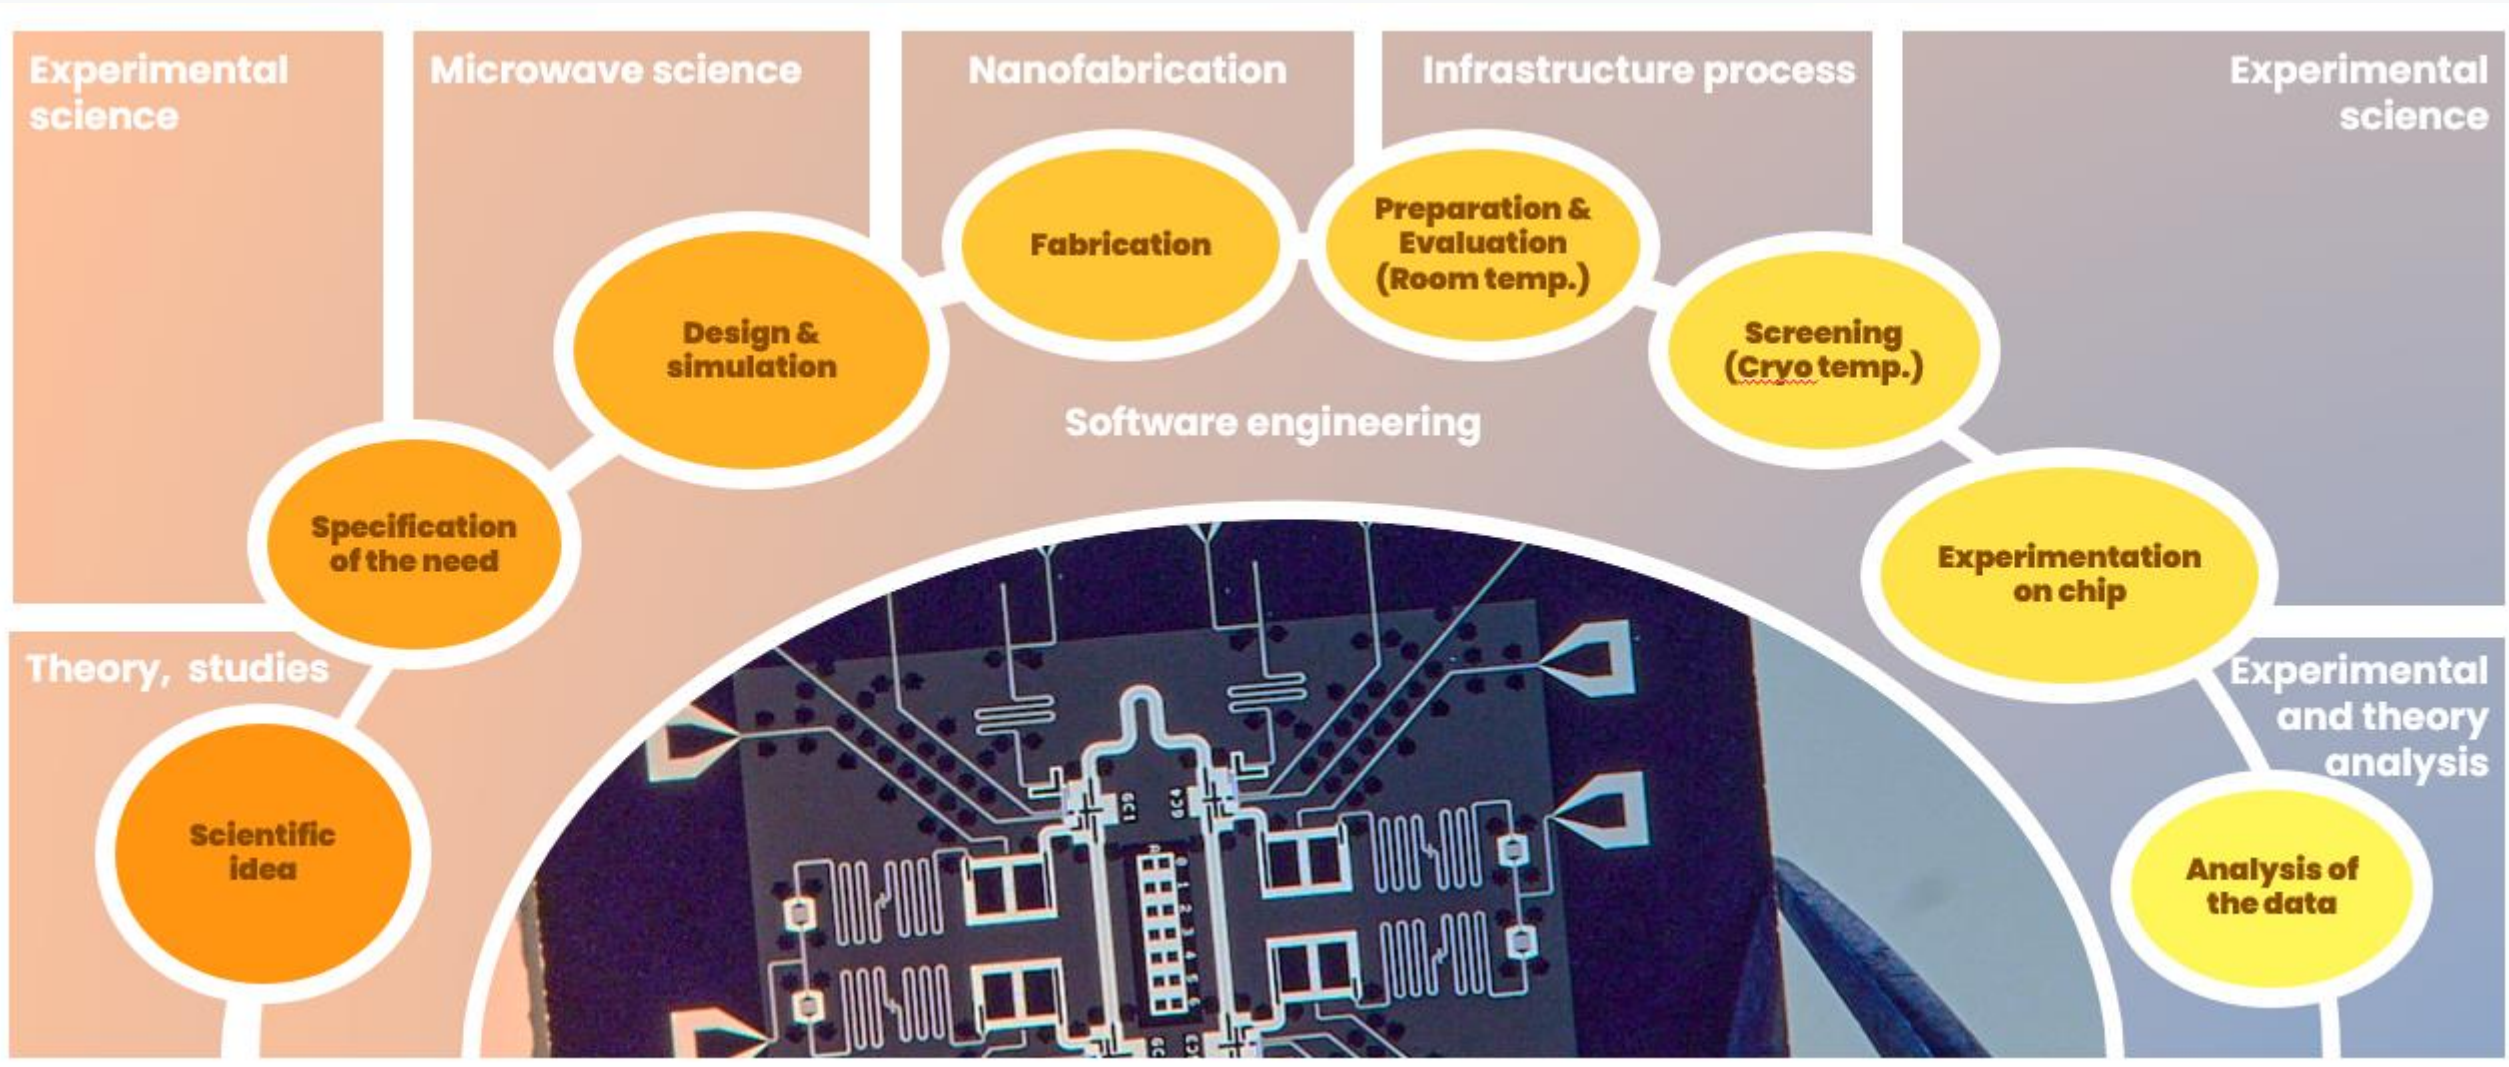

Note
1. Architecture improvement will likely significantly reduce the number of required cats

The example of Control Electronics

Control Electronics

OPX+ , Octave, APMS

Cat qubits need pulses

To stabilize and operate cat qubits, **pulses** are sent through **RF channels** (carrier @4-9GHz).

There is an extreme need of **phase coherence** between output channels.

Similarly, input channels receive pulses to enable **feedback** on next pulses to be sent.

DDS architecture

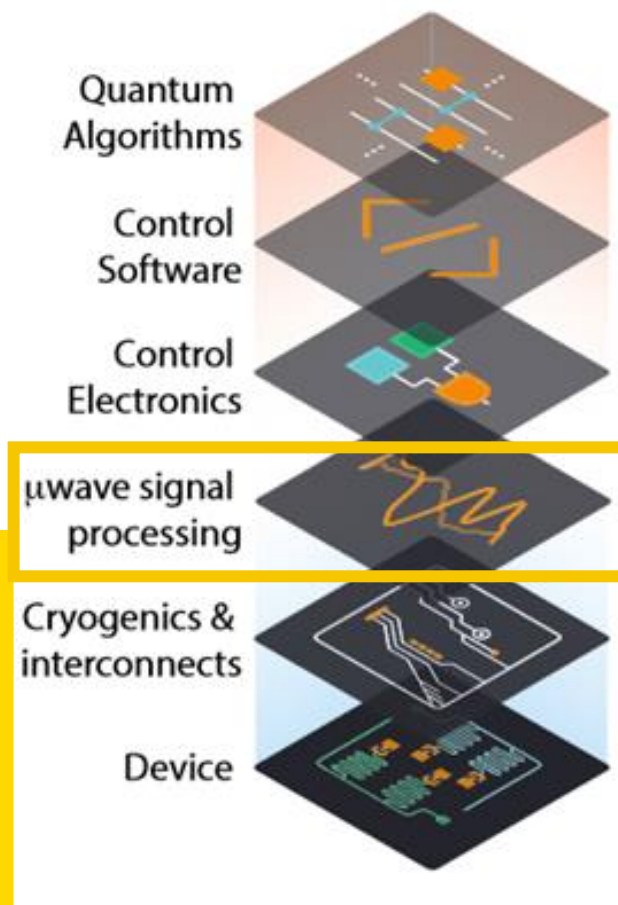

Direct Digital Synthesis use RF DACs that operates at high enough sampling rates that enable to directly synthesize microwave pulses without upconversion.

Example : QICK [2022]

FIG. 1. The Quantum Instrumentation Control Kit (QICK). The QICK consists of two pieces of hardware: the commercial ZCU111 RFSoc evaluation board (left), which connects to the QICK RF board (right) which can be used for additional signal up/downconversion, amplification and filtering.

Analog quality

Analog quality is measured through :

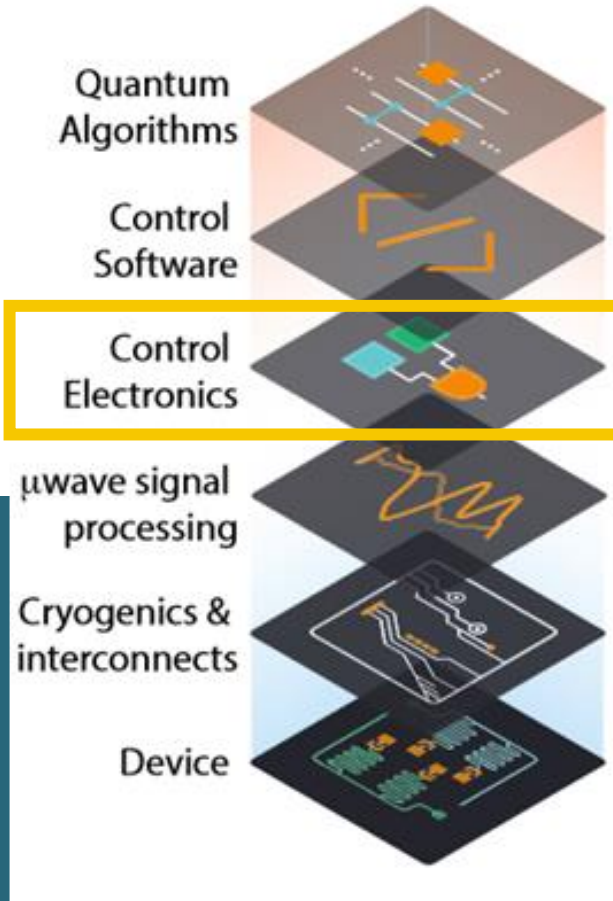

- Frequency precision and stability
- Bandwidth
- Spectral purity
- Phase noise
- Amplitude deviation
- Jitter
- Possible artifacts
- Power efficiency

Those needs and bandwidth range are very similar to **5G / radars requirements.**

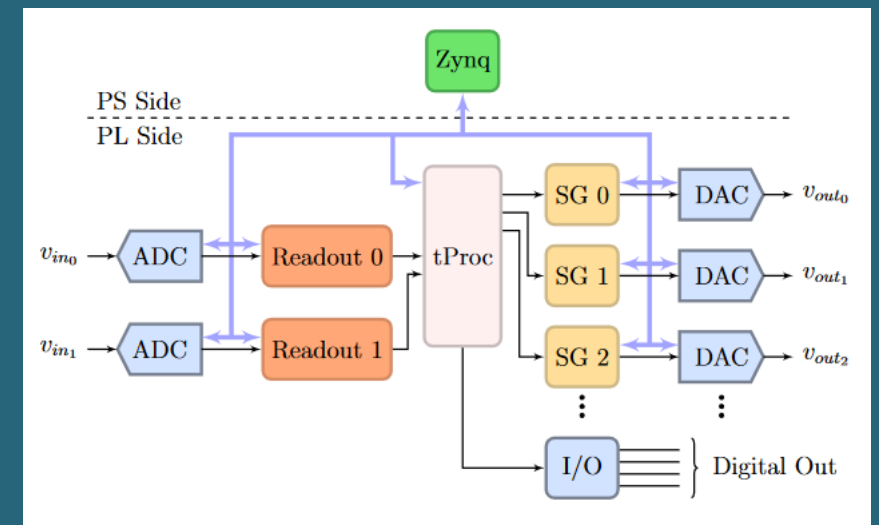

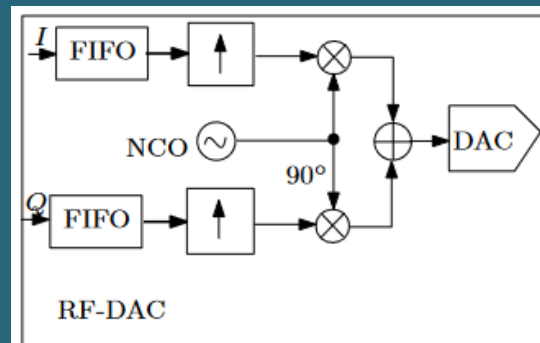

Digital expressiveness

FPGA main building blocks are typically :

- NCO
- Digital up/downconversion
- Pulse library
- Processor for custom timed instructions
- Feedback logic
- I/O

Control electronics will soon face obstacles to improve phase coherence, latency, density, and **scalability**

Core competences rely on generating high quality **RF pulses**

#1 Defining analog quality

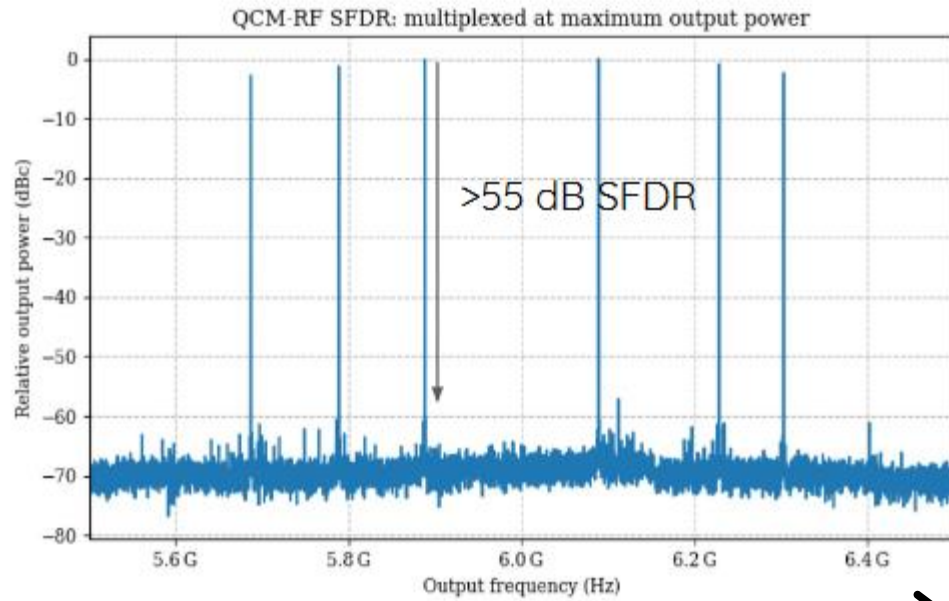

$$s_1(t) = A_1 \cos(\underbrace{\omega_1 t + \phi_1^{init}}_{\text{phase}})$$

$$s_1(t) = A_1 \cos(\underbrace{\omega_1 t + \phi_1^{init}}_{\text{phase}})$$

$$s_1(t) = (A + \delta A_{cst} + \delta A(t) + \delta A_{rel}(t)) \cos((\omega + \delta \omega_{cst} + \delta \omega(t) + \delta \omega_{rel}(t)) t + (\phi + \delta \phi_{cst} + \delta \phi(t) + \delta \phi_{rel}(t)))$$
