

Carbon nanotube based semiconducting quantum computer

Quentin Schaeverbeke

October 31, 2024

single electron spin qubit

γ : Tunnel rate

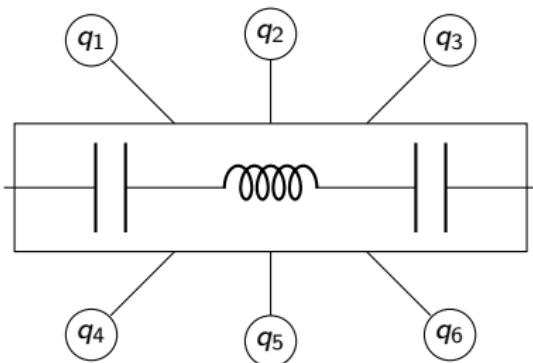

ε : DQD energy bias

$B_L(B_R)$: Magnetic interaction potential

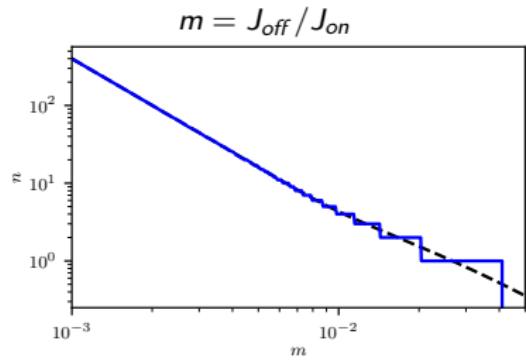

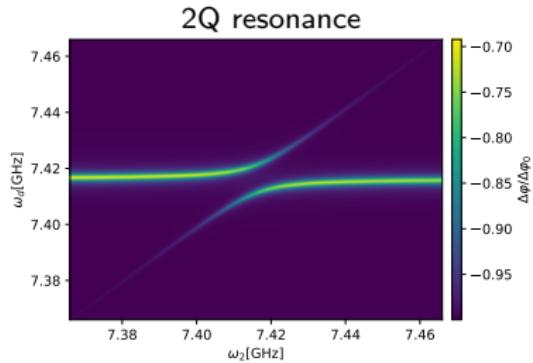

Effective Hamiltonian

$$H = \frac{\varepsilon}{2}\tau_z + \gamma\tau_x + \frac{B_L + B_R}{2}\sigma_z + \frac{B_L - B_R}{2}\sigma_x\tau_z$$

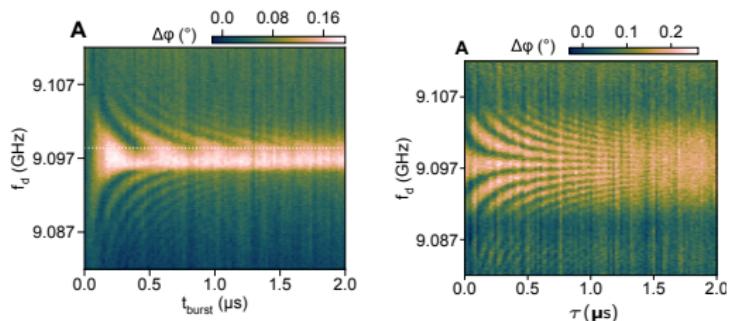

Long range entanglement

$$H = \sum_i \frac{\omega_i}{2} \sigma_z^{(i)} + \sum_{i \neq j} \frac{J_{ij}}{2} \left(\sigma_-^{(i)} \sigma_+^{(j)} + \sigma_+^{(i)} \sigma_-^{(j)} \right)$$

Highest measured coherence times in cQED semiconductors

at $T = 300\text{mK}$

- ▶ $T_2^* = 1\mu\text{s}$
- ▶ $T_1 = 1\mu\text{s}$
- ▶ $T_\varphi = 2\mu\text{s}$
- ▶ $T_{\text{echo}} = 1.6\mu\text{s}$

High-fidelity radio-frequency charge state readout of ultraclean carbon nanotube quantum dot devices
